

Discussion of

*Who Benefits from Robo-advising? Evidence  
from Machine Learning*  
(Rossi and Utkus, 2019)

by Bart Zhou Yueshen, INSEAD

May 28, 2019

# Overview

## Robo-advising: Vanguard Personal Advisor Services, PAS

### What PAS does

- about six months of rebalancing after signup
- bonds ↑↑, equity ↑, cash ↓↓
- almost all in mutual funds: index funds ↑↑, international ↑↑
- fees, expense ratios, turnover, and trading volume ↓↓
- fewer assets (more concentrated holdings), but in indices
- improved abnormal Sharpe ratio

### Cross-section (who benefits)

- nine most relevant explanatory variables
- some nonmonotone effects

- almos
- fees, €
- fewer
- impro

Cross-section

- nine n
- some

# 1. Overall impression

Interesting paper!

- great data
- nice application of regression trees

But...

- results are largely descriptive
- not clear what the objectives are

Would be nice to have some “**tensions**”; e.g.,

- What PAS does: Good to know, but is there a benchmark?
- Who benefits: Implications for investors? For regulations?  
(How to improve? Who should stay away? ...)

## 2. Things I'd like to know more about

- Selection into PAS
- It takes 5~6 months for PAS to build the target portfolio
  - ▶ Why?
  - ▶ How? (Priority for which asset class?)
  - ▶ Cross-section on this build-up time?
- Is PAS target portfolio depending on the investment history pre-PAS?
- Why investments in ETF dropped?

## 2. Things I'd like to know more about

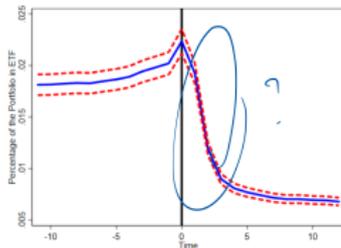

- Selection into PAS
- It takes 5~6 months for PAS to build the target portfolio

(e) Percentage in ETFs

### 3. Comparing performance

#### Timing clarification

- abnormal Sharpe ratios 6 months before and after PAS
- 3-month horizon

#### Benchmark

- current choice: vw NYSE/AMEX/NASDAQ CRSP portfolio
- international exposure? (10%→33%)
- (rationale: to compare with the no-PAS status quo?)

#### Before v.s. after? With v.s. without?

- current comparison: same investor, before and after
- issue: selection (e.g., I've been unlucky for months; try PAS?)
- ideal comparison (to me): twins, one signed up for PAS, one did not
- propensity score matching?

### 3. Comparing performance

#### Timing clarification

- abnormal Sharpe ratios 6 months before and after PAS
- 3-month horizon

#### Benchmark

- current choice: vw NYSE/AMEX/NASDAQ CRSP portfolio
- international exposure? (10%→33%)
- (rationale: to compare with the no-PAS status quo?)

## 4. Boosted Regression Trees, BRT

What BRT does (roughly)

- finding an “optimal” partition of sample  
... then regression within each subsample
- variable selection
- *can* partition on a same  $X$  variable, hence nonmonotonicity

Advantages

- relatively mature/standard procedures and diagnostics
- possibility for researchers to be (more) agnostic
- insights on the importance of many regressors

## 4. Boosted Regression Trees, BRT

What BRT does (roughly)

- finding an “optimal” partition of sample  
... then regression within each subsample
- variable selection
- *can* partition on a same  $X$  variable, hence nonmonotonicity

Advantages

- relatively mature/standard procedures and diagnostics
- possibility for researchers to be (more) agnostic
- insights on the importance of many regressors

## 4. BRT (continued)

What BRT does not address

- identification / channel
- omitted variable problem

(Wanted narrative: PAS benefits XXX most)

Suggestion (with salt?)

- LHS:  $\Delta AbnSharpe_i$  of *all investors*  
(currently, only those signed up for PAS)
- RHS: add dummy of PAS signup  
(and perhaps interactions with other X variables)

Overfitting problem

- currently: shrinkage + bagging + cross-validation
- check also robustness with Random Forest?

## 4. BRT (continued)

What BRT does not address

- identification / channel

Conclusion

# Conclusion

- New evidence about Robo-advising
  - ▶ what they do (and how)
  - ▶ the cross-section of investors
- Thoughts
  - ▶ a bit more “tension” would make the paper more flavorful
  - ▶ the performance measure perhaps can be refined
  - ▶ BRT is useful but also has its limits

# Conclusion

- New evidence about Robo-advising
  - ▶ what they do (and how)
  - ▶ the cross-section of investors
- Thoughts
  - ▶ a bit more “tension” would make the paper more flavorful
  - ▶ the performance measure perhaps can be refined
